

Introduction:

The world of education is ever evolving. Tablets are a widely used electronic device that can be seen as a useful tool in the classroom. Many people argue that tablets should replace textbooks completely in K-12 schools. Others think that there are too many issues with this new technology and that the switch to tablets would be problematic. It is evident that this topic has much to debate, when considering the evidence presented, tablets should be used instead of textbooks.

Body Paragraph 1:

Schools should change from using textbooks to tablets. For example “projects found that more than 40 percent of students or teachers use some sort of tablet in their advanced placement.” This shows that students and teachers already know how to work tablets. Another example is “kids are very comfortable with these things.” This shows that students use tablets or any technology and already knows how to work it.

Body Paragraph 2:

Schools should change from using textbooks to using tablets. For example “more than a half-million students are using discovery’s text.” This shows students already use online stuff. Also, “it’s a systems that’s normal for students, who often already have mastered the technology.” this shows that plenty of students already use technology, so it wouldn’t be much to learn how to use them.

Counterargument:

However, some argue saying textbooks should be used in school ~~while some may not.~~ In reality we should switch to tablets because a ton of children now are used to using the internet. We can see this by being told that using online methods could be easier. Professionals can testify that kids are more prone to learn better using tablets, instead of reading out of a book. Research shows that kids are using technology everyday and know how to use it. Using tablets is best because everyone these days uses technology in their everyday lives. In which case, it shouldn’t be hard to use tablets in school.

Conclusion:

The world of education is ever evolving. Tablets are a widely used electronic device that can be seen as a useful tool in the classroom. Many people argue that tablets should replace textbooks completely in K-12 schools. Others think that there are too many issues with this new technology and that the switch to tablets

would be problematic. It is evident that this topic has much to debate, when considering the evidence presented, explains why using tablets instead of textbooks are better.
